SC4518 600kHz, 2A Step-Down Switching Regulator

POWER MANAGEMENT

Description

The SC4518 is a current mode switching regulator with an integrated switch, operating at 600kHz with separate sync and enable functions. The integrated switch allows for cost effective low power solutions (peak switch current 2 amps). The sync function allows customers to synchronize to a faster clock in order to avoid frequency beating in noise sensitive applications. High frequency of operation allows for very small passive components. Current mode operation allows for fast dynamic response and instantaneous duty cycle adjustment as the input varies (ideal for CPE applications where the input is a wall plug power).

The low shutdown current makes it ideal for portable applications where battery life is important.

The SC4518 is a 600kHz switching regulator synchronizable to a faster frequency from 750kHz to 1.2MHz.

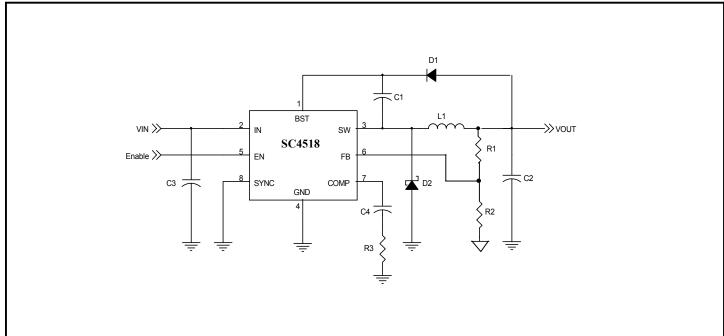

Features

- ◆ Integrated 2 Amp switch
- 600kHz frequency of operation
- Current mode controller
- ◆ Synchronizable to higher frequency up to 1.2MHz
- ◆ 6µA low shutdown current
- SO-8 EDP package

Applications

- ♦ XDSL modems
- CPE equipment
- DC-DC point of load applications
- ◆ Portable equipment

Typical Application Circuit

Absolute Maximum Ratings

Exceeding the specifications below may result in permanent damage to the device, or device malfunction. Operation outside of the parameters specified in the Electrical Characteristics section is not implied. Exposure to Absolute Maximum rated conditions for extended periods of time may affect device reliability.

Parameter	Symbol	Limits	Units
Input Supply Voltage	V _{IN}	-0.3 to +16	V
Boost Pin Above V _{sw}	(V _{BST} - V _{SW})	16	V
Boost Pin Voltage	V _{BST}	-0.3 to +32	V
EN Pin Voltage	V _{EN}	-0.3 to +16	V
FB Pin Voltage	$V_{\scriptscriptstyle{FB}}$	-0.3 to +6	V
FB Pin Current	I _{FB}	1	mA
SYNC Pin Current	I _{SYNC}	1	mA
Thermal Impedance Junction to Ambient (1)	θ_{JA}	36.5	°C/W
Operating Ambient Temperature Range	T _A	-40 to +85	°C
Operating Junction Temperature Range	T _J	-40 to +150	°C
Storage Temperature Range	T _{stg}	-65 to +150	°C
Lead Temperature (Soldering) 10 sec	T _{LEAD}	300	°C
ESD Rating (Human Body Model)	ESD	2	kV

Note: (1) Minimum pad size.

Electrical Characteristics

Unless specified: V_{IN} = 12V, V_{COMP} = 0.8V, V_{BST} = V_{IN} + 5V, EN = tied to V_{IN} , SYNC = 0, SW = open. T_A = T_J = -40°C to 125°C.

Parameter	Symbol	Conditions	Min	Тур	Max	Units
Maximum Switch Current Limit	I _{sw}			2.0		А
Oscillator Frequency	f _{osc}		550	625	750	kHz
Switch On Voltage Drop	V _{D(SW)}	I _{SW} = 1.5A		330		mV
V _N Undervoltage Lockout	V _{UVLO}			2.60	3	V
V _N Supply Current	I _Q	V _{FB} = V _{OUT(NOM)} + 17%		1.0	5	mA
Standby Current	l _{Q(OFF)}	V _{EN} = 0V, V _{IN} = 16V, V _{SW} = 0V		5	45	μA

Electrical Characteristics (Cont.)

Unless specified: V_{IN} = 12V, V_{COMP} = 0.8V, V_{BST} = V_{IN} + 5V, EN = tied to V_{IN} , SYNC = 0, SW = open. $T_A = T_J = -40$ °C to 125°C.

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
FB Input Current	I _{FB}			-0.25	-0.50	μA
Feedback Voltage		3V < V _{IN} < 16V ⁽¹⁾	1.176	1.2	1.224	V
Feedback Voltage Line Regulation				+3		mV/V

V _{COMP} Pin Maximum Switching Threshold		Duty cycle = 0%		0.35		V
V _{COMP} Pin Threshold		I _{SW} = 1.5A		0.9		V
Maximum Switch Duty Cycle		V _{COMP} = 1.2V, I _{SW} = 400mA	85	95		%
Minimum Boost Voltage Above Switch		I_{SW} = 1.5A, 0°C ≤ T_{A} ≤ 125°C and I_{SW} = 1.3A, T_{A} < 0°C		1.8	2.7	V
Boost Current		I _{SW} = 0.5A		10	15	mA
		I_{SW} = 1.5A, 0°C ≤ T_{A} ≤ 125°C and I_{SW} = 1.3A, T_{A} < 0°C		30	45	

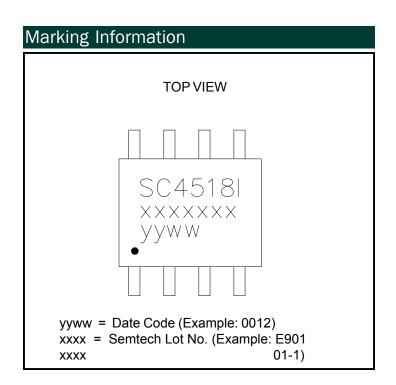

Electrical Characteristics (Cont.)

Unless specified: V_{IN} = 12V, V_{COMP} = 0.8V, V_{BST} = V_{IN} + 5V, EN = tied to V_{IN} , SYNC = 0, SW = open. T_A = T_J = -40°C to 125°C.

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Enable Input Threshold Voltage	V _{IH}		2			V
	V _{IL}				0.4	V
Enable Input Bias Current	I	EN = 60mV above threshold		2.5		μΑ
	I _{IH}	EN = 100mV below threshold		5	15	μΑ
SYNC Threshold Voltage				1.5		V
SYNC Input Frequency (3)			700		1200	kHz
SYNC Pin Resistance		V _{SYNC} = 0.5V		20		kΩ

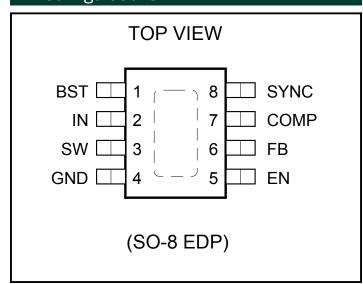

Notes:

- (1) The required minimum input voltage for a regulated output depends on the output voltage and load condition.
- (2) Guaranteed by design.
- (3) For SYNC applications, please contact factory.

Pin Configurations

Ordering Information

Part Number (2)	Package (1)
SC4518ISTRT	SO-8 EDP
SC4518EVB	EVALUATION BOARD

Notes:

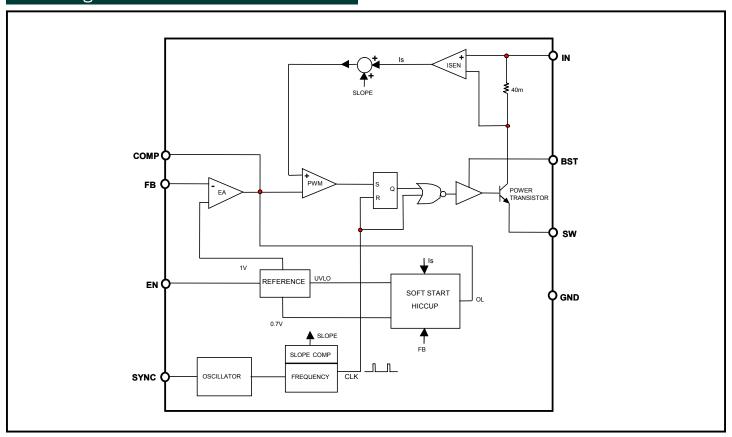

- (1) Only available in tape and reel packaging. A reel contains 2500 devices.
- (2) Lead free product. This product is fully WEEE and RoHS compliant.

Pin Descriptions

Pin #	Pin Name	Pin Function
1	BST	This pin provides power to the internal NPN switch. The minimum turn on voltage for this switch is 2.7V.
2	IN	Pin IN delivers all power required by control and power circuitry. This pin sees high di/dt during switching actions of the switch. A decoupling capacitor should be attached to this pin as close as possible.
3	SW	Pin SW is the emitter of the internal switch. The external freewheeling diode should be connected as close as possible to this pin.
4	GND	All voltages are measured with respect to this pin. The decoupling capacitor and the freewheeling diode should be connected to GND as short as possible.
5	EN	This is the chip enable input. The regulator is switched on if EN is high, and it is off if EN is low. The regulator is in standby mode when EN is low, and the input supply current is reduced to a few microamperes.
6	FB	Feedback input for adjustable output controllers.
7	COMP	This is the output of the internal error amplifier and input of the peak current comparator. A compensation network is connected to this pin to achieve the specified performance.
8	SYNC	This is synchronous control pin used to synchronize the internal oscillator to an external pulse control signal. When not used, it should be connected to GND.
-	THERMAL PAD	Pad for heatsinking purposes. Connect to ground plane using multiple vias. Not connected internally.

Block Diagram

Application Information

General Overview

The SC4518 is a current mode buck converter regulator. SC4518 has an internal fixed-frequency clock. The SC4518 uses two feedback loops that control the duty cycle of the internal power switch. The error amplifier functions like the one of the voltage mode converter. The current sense amplifier in the SC4518 monitors the switch current during each cycle. If the output voltage is lower than 68.75% of its nominal value along with an over-current condition, a hiccup mode operation is invoked to prevent excess power dissipation in the switch. Setting the RS flip-flop from an oscillator pulse turns on the switch. As the switch peak current reaches a level preset by the inverting input of the comparator, the flipflop is reset and then the switch is turned off. The output of the error amplifier works as a switch current reference. This technique effectively removes one of the double poles in the voltage mode system. With this, it is much easier to compensate a current mode converter to have better performance. A minimum 2.7V voltage is required to saturate the switch when it is on to reduce its conduction loss.

Enable

Pulling and holding the EN pin below 0.4V activates the shut down mode of the SC4518 which reduces the input supply current to less than $10\mu A$. During the shut down mode, the switch is turned off. The SC4518 is turned on if the EN pin is pulled high.

Oscillator

Its internal free running oscillator sets the PWM frequency at 600kHz for the SC4518 without any external components to program the frequency. An external clock with a duty cycle from 20% to 80% connected to the SYNC pin activates synchronous mode. The frequency of the external clock can be from 750kHz to 1.2MHz.

UVLO

When the EN pin is pulled and held above 1.8V, the voltage on Pin IN determines the operation of the SC4518. As VIN increases during power up, the internal circuit senses VIN and keeps the power transistor off until VIN reaches 2.6V.

Load Current

The peak current I_{PEAK} in the switch is internally limited. For a specific application, the allowed load current I_{OMAX} will change if the input voltage drifts away from the original design as given for continuous current mode:

$$I_{OMAX} = 2 - \frac{V_O \cdot (1 - D)}{2 \cdot L \cdot f_s}$$

Where:

fs = switching frequency,

Vo = output voltage and

D = duty ratio, Vo/VI

V = input voltage.

Figure 1 shows the theoretical maximum load current for the specific cases. In a real application, however, the allowed maximum load current also depends on the layout and the air cooling condition. Therefore, the maximum load current may need to be degraded according to the thermal situation of the application.

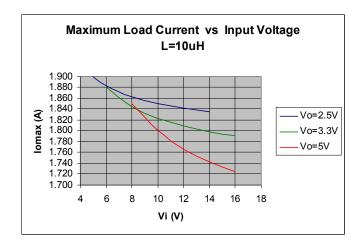

Figure 1. Theoretical maximum load current curves

Inductor Selection

The factors for selecting the inductor include its cost, efficiency, size and EMI. For a typical SC4518 application, the inductor selection is mainly based on its value, saturation current and DC resistance. Increasing the inductor value will decrease the ripple level of the output voltage while the output transient response will be

Application Information (Cont.)

degraded. Low value inductors offer small size and fast transient responses while they cause large ripple currents, poor efficiencies and more output capacitance to filter out the large ripple currents. The inductor should be able to handle the peak current without saturating and its copper resistance in the winding should be as low as possible to minimize its resistive power loss. A good trade-off among its size, loss and cost is to set the inductor ripple current to be within 15% to 30% of the maximum output current.

The inductor value can be determined according to its operating point under its continuous mode and the switching frequency as follows:

$$L = \frac{V_{O} \cdot (V_{I} - V_{O})}{V_{I} \cdot f_{s} \cdot \Delta I \cdot I_{OMAX}}$$

Where:

fs = switching frequency,

 ΔI = ratio of the peak to peak inductor current to the output load current and

 V_0 = output voltage.

The peak to peak inductor current is:

$$I_{p-p} = \Delta I \bullet I_{OMAX}$$

$$I_{PEAK} = I_{OMAX} + \frac{I_{p-p}}{2}$$

After the required inductor value is selected, the proper selection of the core material is based on the peak inductor current and efficiency specifications. The core must be able to handle the peak inductor current I_{PEAK} without saturation and produce low core loss during the high frequency operation.

The power loss for the inductor includes its core loss and copper loss. If possible, the winding resistance should be minimized to reduce inductor's copper loss. The core must be able to handle the peak inductor current I without saturation and produce low core loss during the high frequency operation. The power loss for the inductor includes its core loss and copper loss. If possible, the winding resistance should be minimized to reduce inductor's copper loss. The core loss can be found in the manufacturer's datasheet. The inductor's copper loss can be estimated as follows:

$$P_{COPPER} = I^2_{LRMS} \cdot R_{WINDING}$$

Where:

 \mathbf{I}_{LRMS} is the RMS current in the inductor. This current can be calculated as follows:

$$I_{LRMS} = I_{OMAX} \cdot \sqrt{1 + \frac{1}{3} \cdot \Delta I^2}$$

Output Capacitor Selection

Basically there are two major factors to consider in selecting the type and quantity of the output capacitors. The first one is the required ESR (Equivalent Series Resistance) which should be low enough to reduce the output voltage deviation during load changes. The second one is the required capacitance, which should be high enough to hold up the output voltage. Before the SC4518 regulates the inductor current to a new value during a load transient, the output capacitor delivers all the additional current needed by the load. The ESR and ESL of the output capacitor, the loop parasitic inductance between the output capacitor and the load combined with inductor ripple current are all major contributors to the output voltage ripple. Surface mount ceramic capacitors are recommended.

Input Capacitor Selection

The input capacitor selection is based on its ripple current level, required capacitance and voltage rating. This capacitor must be able to provide the ripple current by the switching actions. For the continuous conduction mode, the RMS value of the input capacitor current $I_{\text{CIN/RMS}}$ can be calculated from:

$$I_{\text{CIN(RMS)}} = I_{\text{OMAX}} \cdot \sqrt{\frac{V_{\text{O}} \cdot (V_{\text{I}} - V_{\text{O}})}{V_{\text{I}}^2}}$$

This current gives the capacitor's power loss through its $\mathbf{R}_{\text{CIN(ESR)}}$ as follows:

$$P_{CIN} = I^2_{CIN(RMS)} \bullet R_{CIN(ESR)}$$

The input ripple voltage mainly depends on the input capacitor's ESR and its capacitance for a given load, input voltage and output voltage. Assuming that the input current of the converter is constant, the required input capacitance for a given voltage ripple can be calculated by:

Application Information (Cont.)

$$C_{\text{IN}} = I_{\text{OMAX}} \cdot \frac{D \cdot (1 - D)}{\text{fs} \cdot (\Delta V_{I} - I_{\text{OMAX}} \cdot R_{\text{CIN(ESR)}})}$$

Where:

 ΔV_i = the given input voltage ripple.

Because the input capacitor is exposed to the large surge current, attention is needed for the input capacitor. If tantalum capacitors are used at the input side of the converter, one needs to ensure that the RMS and surge ratings are not exceeded. For generic tantalum capacitors, it is suggested to derate their voltage ratings at a ratio of about two to protect these input capacitors.

Boost Capacitor and its Supply Source Selection

The boost capacitor selection is based on its discharge ripple voltage, worst case conduction time and boost current. The worst case conduction time T can be estimated as follows:

$$\mathsf{T}_{\mathsf{W}} = \frac{1}{\mathsf{f}_{\mathsf{s}}} \cdot \mathsf{D}_{\mathsf{max}}$$

Where:

 f_s = the switching frequency and Dmax = maximum duty ratio, 0.9 for the SC4518.

The required minimum capacitance for the boost capacitor will be:

$$C_{boost} = \frac{I_B}{V_D} \cdot T_W$$

Where:

 $I_{\rm B}$ = the boost current and $V_{\rm D}$ = discharge ripple voltage.

With f_s = 600kHz, V_D = 0.5V and I_B =0.045A, the required minimum capacitance for the boost capacitor is:

$$C_{boost} = \frac{I_{B}}{V_{D}} \cdot \frac{1}{f_{s}} \cdot D_{max} = \frac{0.045}{0.5} \cdot \frac{1}{600k} \cdot 0.9 = 135 nF$$

The internal driver of the switch requires a minimum 2.7V to fully turn on that switch to reduce its conduction loss. If the output voltage is less than 2.7V, the boost capacitor can be connected to either the input side or an independent supply with a decoupling capacitor. But the Pin BST should not see a voltage higher than its maximum rating.

Freewheeling Diode Selection

This diode conducts during the switch's off-time. The diode should have enough current capability for full load and short circuit conditions without any thermal concerns. Its maximum repetitive reverse block voltage has to be higher than the input voltage of the SC4518. A low forward conduction drop is also required to increase the overall efficiency. The freewheeling diode should be turned on and off fast with minimum reverse recovery because the SC4518 is designed for high frequency applications. SS13 Schottky rectifier is recommended for certain applications. The average current of the diode, I_{D-AVG} can be calculated by:

$$I_{D \text{ AVG}} = I_{O \text{max}} \cdot (1 - D)$$

Thermal Considerations

There are three major power dissipation sources for the SC4518. The internal switch conduction loss, its switching loss due to the high frequency switching actions and the base drive boost circuit loss. These losses can be estimated as:

$$P_{total} = I_o^2 \cdot R_{on} \cdot D + 11.25 \cdot 10^{-3} \cdot I_o \cdot V_I + \frac{10}{500} \cdot I_o \cdot D \cdot (V_{boost})$$

Where:

 $I_o = load current;$

 $\vec{V}_{\text{BOOST}}^{\text{ON}}$ = on-equivalent resistance of the switch; $\vec{V}_{\text{BOOST}}^{\text{ON}}$ = input voltage or output based on the boost circuit connection.

The junction temperature of the SC4518 can be further decided by:

$$T_{IJ} = T_A + \theta_{JA} \cdot P_{total}$$

 $\theta_{\text{\tiny IA}}$ is the thermal resistance from junction to ambient. Its value is a function of the IC package, the application layout and the air cooling system.

The freewheeling diode also contributes a significant portion of the total converter loss. This loss should be minimized to increase the converter efficiency by using Schottky diodes with low forward drop (V_E).

$$P_{diode} = V_F \cdot I_o \cdot (1-D)$$

Application Information (Cont.)

Loop Compensation Design

Assuming the power stage ESR (equivalent series resistance) zero is an order of magnitude higher than the closed loop bandwidth, which is typically one tenth of the switching frequency, the power stage control to output transfer function with the current loop closed (Ridley model) for the SC4518 will be as follows:

$$G_{VD}(s) = \frac{2.5 \cdot R_L}{1 + \frac{s}{\frac{1}{R_L \cdot C}}}$$

Where:

R_i – Load and

C - Output capacitor.

The goal of the compensation design is to shape the loop to have a high DC gain, high bandwidth, enough phase margin, and high attenuation for high frequency noises. Figure 2 gives a typical compensation network which offers 2 poles and 1 zero to the power stage:

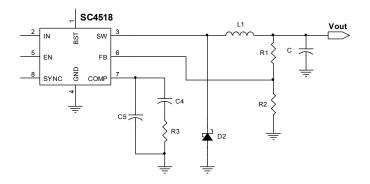

Figure 2.

Figure 2. Compensation network provides 2 poles and 1 zero.

The compensation network gives the following characteristics:

$$G_{COMP}(s) = \omega_1 \cdot \frac{1 + \frac{s}{\omega_z}}{s \cdot (1 + \frac{s}{\omega_{P2}})} \cdot g_m \cdot \frac{R_2}{R_1 + R_2}$$

Where:

$$\omega_1 = \frac{1}{C_4 + C_5}$$

$$\omega_{Z} = \frac{1}{R_{3} \cdot C_{4}}$$

$$\omega_{P2} = \frac{C_4 + C_5}{R_3 \cdot C_4 \cdot C_5}$$

The loop gain will be given by:

$$T(s) = G_{\text{COMP}}(s) \cdot G_{\text{VD}}(s) = 2.125 \cdot 10^{-3} \cdot \frac{R_{L}}{C_{4}} \cdot \frac{R_{2}}{R_{1} + R_{2}} \cdot \frac{1}{s} \frac{1 + \frac{s}{\omega_{z}}}{(1 + \frac{s}{\omega_{p_{1}}}) \cdot (1 + \frac{s}{\omega_{p_{2}}})}$$

Where:

$$\omega_{p1} = \frac{1}{R_L \cdot C}$$

One integrator is added at origin to increase the DC gain. $\omega_{_{\! Z}}$ is used to cancel the power stage pole $\omega_{_{\! P1}}$ so that the loop gain has -20dB/dec rate when it reaches 0dB line. $\omega_{_{\! P2}}$ is placed at half switching frequency to reject high frequency switching noises. Figure 3 gives the asymptotic diagrams of the power stage with current loop closed and its loop gain.

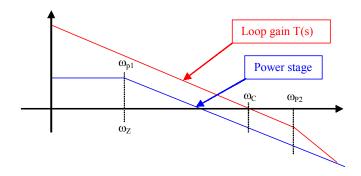

Figure 3

Figure 3. Asymptotic diagrams of power stage with current loop closed and its loop gain.

Application Information (Cont.)

The design guidelines for the SC4518 applications are as following:

- 1. Set the loop gain crossover corner frequency ω_c for given switching corner frequency $\omega_c = 2\pi f$.
- 2. Place an integrator at the origin to increase $\overset{\circ}{DC}$ and low frequency gains.
- 3. Select ω_z such that it is placed at ω_{P1} to obtain a -20dB/dec rate to go across the 0dB line.
- 4. Place a high frequency compensator pole $\omega_{P2} (\omega_{P2} = \pi f_s)$ to get the maximum attenuation of the switching ripple and high frequency noise with the adequate phase lag at ω_c

Layout Guidelines:

In order to achieve optimal electrical and thermal performance for high frequency converters, special attention must be paid to the PCB layouts. The goal of layout optimization is to identify the high di/dt loops and minimize them. The following guidelines should be used to ensure proper operation of the converters.

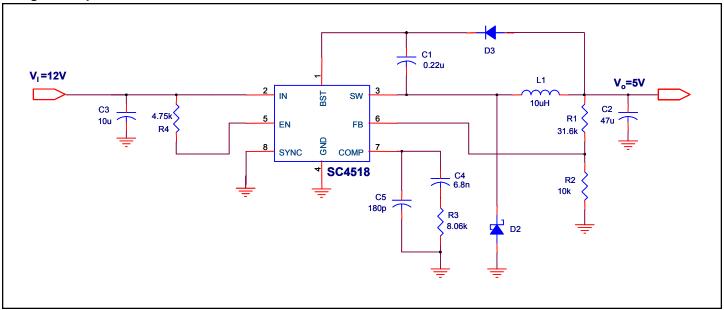

- A ground plane is suggested to minimize switching noises and trace losses and maximize heat transferring.
- Start the PCB layout by placing the power components first. Arrange the power circuit to achieve a clean power flow route. Put all power connections on one side of the PCB with wide copper filled areas if possible.
- 3. The V_{IN} bypass capacitor should be placed next to the V_{IN} and GND pins.
- The trace connecting the feedback resistors to the output should be short, direct and far away from any noise sources such as switching node and switching components.
- Minimize the loop including input capacitor, the SC4518 and freewheeling diode D₂. This loop passes high di/dt current. Make sure the trace width is wide enough to reduce copper losses in this loop.
- Maximize the trace width of the loop connecting the inductor, freewheeling diode D₂ and the output capacitor.
- Connect the ground of the feedback divider and the compensation components directly to the GND pin of the SC4518 by using a separate ground trace.

8. Connect Pin 4 to a large copper area to remove the IC heat and increase the power capability of the SC4518. A few feedthrough holes are required to connect this large copper area to a ground plane to further improve the thermal environment of the SC4518. The traces attached to other pins should be as wide as possible for the same purpose.
